

DocPilot AI: Hindsight Persistent Memory Integration

Hackathon Submission Reference & Architecture Guide

Transforming Document & Contract Intelligence from Stateless LLM Analysis into an Institutional Memory System using Vectorize Hindsight.

1. What Problem We Are Solving

The "Amnesia Flaw" in Traditional Document AI

In real-world enterprises (legal, compliance, procurement, and finance), teams review hundreds of agreements every month: Master Services Agreements (MSAs), NDAs, Vendor SOWs, and audit reports.

Conventional LLM document tools analyze each file in a complete vacuum. Every time a contract is uploaded, the AI:

- 1. **Has Zero Counterparty Context:** It doesn't know what terms your organization previously rejected or accepted for a recurring vendor (e.g. *Acme Corp*).
- 2. **Flags Recurring False Positives:** If legal approved a specific liability exception or custom SLA last quarter, a stateless AI will flag the exact same clause as a critical risk every single time.
- 3. **Cannot Learn from Human Decisions:** When a user overrides a risk flag or accepts a redline, the system forgets that institutional knowledge immediately.

The Solution: DocPilot AI Powered by Hindsight

DocPilot AI integrates **Hindsight by Vectorize** to establish an **Institutional Memory Bank**. Instead of forgetting past interactions, DocPilot AI remembers historical negotiations, recalls past approved exceptions, and continuously improves its risk assessments across every contract.

2. How Hindsight Memory is Architected & Used

Core Operations:

- 1. **Recall** (`hindsight_service.recall`): - During document intake, the **Hindsight Memory Agent** analyzes extracted entities (e.g., *Acme Corp*) and clauses (*Liability, Indemnification, Payment Terms*). - It queries the active memory bank (`docpilot-legal-bank`) for applicable policies, negotiated baselines, and historical exceptions. - Recalled memories are correlated with flagged risks. If an approved exception exists, the risk severity is calibrated and badged with a memory citation.
- 2. **Retain** (`hindsight_service.retain`): - **Autonomous Learning**: When analysis completes, summary facts, detected risk scores, and entity milestones are retained in Hindsight for future cross-contract reasoning. - **Interactive Human-in-the-Loop ("Teach Agent")**: Legal teams can teach new rules or approve exceptions directly from the UI, updating the bank in real time.
- 3. **Memory-Augmented Conversational Chat** (`/api/chat`): - The interactive chat assistant recalls Hindsight memories relevant to the user's questions, enabling answers like:
"In our October 2024 review with Acme Corp, we accepted a 1x liability cap (\$500k max) because they provided an active cyber insurance policy."

3. "Before Memory vs. After Memory" (The Wow Factor)

Dimension	❌ Without Memory (Stateless AI)	✅ With Hindsight Memory (DocPilot AI)
Vendor Liability Review	Flags 1x liability cap as Critical Risk Violation . Demands 2x standard cap.	Recalls Precedent #mem_seed_001 : Executive Legal already approved 1x cap for Acme Corp. Auto-calibrates risk.
Payment Terms	Evaluates Net-45 in isolation with generic comments.	Validates against Corporate Policy #mem_seed_002 (Net-30/45 standard) and confirms compliance.
Human Feedback	Forgets lawyer redlines immediately after the session.	Retains approvals and exceptions in Hindsight; next contract automatically respects the decision.
Cross-Document Q&A	Answers: <i>"I can only see the text in the currently uploaded document."</i>	Answers: <i>"Across your last 3 reviews with this vendor, you compromised on termination notice but held firm on mutual IP indemnification."</i>

4. 3-Minute Hackathon Demo Script (Ready to Record 🎬)

[0:00 – 0:45] The Hook & The Problem

- **Visual**: Show DocPilot AI landing screen (<http://localhost:3000>) with the glowing **"Hindsight Memory Active"** badge in the header.

- **Narrator:**

"Today's document AI tools have severe amnesia. When a lawyer or procurement officer reviews an agreement, the AI has zero memory of what was negotiated with that vendor last month. Every review starts from scratch, wasting hundreds of legal hours. Today, we're showing DocPilot AI: an autonomous document intelligence platform powered by Vectorize Hindsight."

[0:45 – 1:45] The Multi-Agent Pipeline & Memory Recall in Action

- **Visual:** Upload `DocPilot_Test_Agreement.pdf` (or any vendor agreement).

- **Narrator:**

"Watch our multi-agent pipeline execute. Intake, Classification, Entity Extraction, Clause Intelligence, and Risk Analysis all run autonomously. But look at Step 10: The Hindsight Memory Agent queries our corporate memory bank."

- **Visual:** Transition into the dashboard. Switch to the "  **Hindsight Memory Engine** " tab.

- **Narrator:**

"Here in the Hindsight Memory Engine, notice the 'Recalled Precedents'. For Acme Corp, the agent recalled our historical approved exception from October 2024. Because Acme Corp previously provided cyber insurance, our 1x annual liability cap was already vetted. Look at the Risk Register: instead of raising a redundant false alarm, DocPilot AI flags the clause with a '  Hindsight Precedent ' badge."

[1:45 – 2:30] Interactive Human-in-the-Loop ("Teach Agent")

- **Visual:** Click the **"Teach Agent Policy"** button in the Hindsight Memory Engine tab.

- **Action:** Enter a new rule:

- **Category:** Approved Exception

- **Content:** "Approved custom 45-day SLA review period for Acme Corp cloud infrastructure."

- **Tags:** `Acme Corp, SLA, exception`

Click **"Retain to Memory"**.

- **Visual:** The new rule instantly appears in the Institutional Memory Bank list with ID and confidence score.

- **Narrator:**

"We can teach the agent new policies directly in the workflow. With one click, this rule is permanently retained into Hindsight. Next time any team member uploads a document from Acme Corp, DocPilot AI recalls this approval instantly."

[2:30 – 3:00] Memory Q&A & Conclusion

- **Visual:** Switch to **"AI Q&A Chat"** tab.

- **Prompt:** *"What liability cap did we previously agree on with Acme Corp?"*

- **Visual:** The assistant responds citing Hindsight Institutional Memory and previous agreements.
- **Narrator:**
"DocPilot AI turns static PDFs into continuous organizational learning. Built with Next.js, FastAPI, Google Gemini, and Vectorize Hindsight. Thank you!"

5. Ready-to-Publish Social Media Post (LinkedIn / X)

LinkedIn Post Draft

Stateless AI is yesterday's news. Today, we're unveiling DocPilot AI: Autonomous Document Intelligence with Hindsight.

The biggest problem with document analyzers today is "Stateless Amnesia":
When legal or procurement teams review a contract from a recurring vendor, generic AI has zero memory of previous interactions.

With Hindsight by Vectorize, DocPilot AI changes the game:

- 🔴 **Precedent Recall:** Cross-checks incoming contracts against approved liability caps, payment policies, and more.
- 🔴 **Continuous Learning (Retain):** Retains legal overrides and negotiation decisions across documents so they're always up-to-date.
- 🔴 **Memory Inspector UI:** A dedicated live dashboard showing recalled corporate rules and an interactive "Timeline" view.

Check out our demo video and GitHub repo below!

6. Official Submission Checklist

- ✓ **Hindsight Python SDK installed:** `hindsight-client` integrated into backend.
- ✓ **Core operations implemented:** `recall`, `retain`, `list_memories`, `status`.
- ✓ **Agent Pipeline integrated:** `Hindsight Memory Agent` running in multi-agent pipeline.
- ✓ **UI Memory Engine Component:** `HindsightMemoryInspector.tsx` tab with Before/After comparison toggle.
- ✓ **Memory Badging:** Risk Register displays 🔴 `Hindsight Precedent` tags.
- ✓ **Memory Q&A:** Chat agent passes recalled memories into LLM context.
- ✓ **Clean Fallback:** Resilient hybrid bank ensures 100% demo reliability under any network condition.
